PROGRESS NOTE
Office visit, established patient

Patient: Reyes, Dana	**DOB:** 04/12/1991 (35 y)	**Sex:** F
MRN: RB-2204871	**Date of service:** 10/02/2026	**Provider:** Morgan Patel, MD, Gastroenterology

Chief complaint

Ulcerative colitis flare.

History of present illness

35-year-old woman with ulcerative pancolitis diagnosed in 2021, seen for worsening symptoms over 5 weeks. She reports **8 to 10 stools a day with blood** in most stools, 2 to 3 nocturnal stools, urgency and lower abdominal cramping. Weight down 3 kg since June. No fever, no recent antibiotics or travel. Colonoscopy 09/18/2026 showed severe pancolitis (Mayo endoscopic subscore 3); biopsies showed chronic active colitis without dysplasia. Labs 09/25/2026: CRP 24 mg/L, fecal calprotectin 1,140 µg/g, hemoglobin 10.6 g/dL, albumin 3.3 g/dL. Prednisone 40 mg daily started by phone on 09/28/2026 with partial improvement in bleeding.

IBD history

Ulcerative pancolitis, diagnosed 03/2021. Failed mesalamine. Prior biologic, see 2024 notes. Advanced therapy deferred after 09/2024 while she lacked adequate coverage; managed since with mesalamine and prednisone courses. Now covered through her employer (Lakeshore Health Plan PPO, effective 08/01/2026).

Current medications

- Mesalamine DR 1.2 g tablets, 4 tablets (4.8 g) by mouth once daily
- Prednisone 40 mg by mouth once daily (started 09/28/2026)
- Ferrous sulfate 325 mg by mouth once daily

Allergies

Sulfa antibiotics (rash).

Vitals

BP 112/70 | HR 94 | Temp 98.9 °F | Wt 59.0 kg | Ht 165 cm | BMI 21.7

Exam

Thin, in no acute distress. Abdomen soft, mild left lower quadrant tenderness, no rebound or guarding. No perianal disease. No rash, no joint swelling.

Disease activity

Mayo score 10 of 12 (stool frequency 3, rectal bleeding 2, endoscopic findings 3 on 09/18/2026, physician global assessment 2).

Assessment

Moderately to severely active ulcerative pancolitis with rectal bleeding (K51.011), steroid-dependent course.

Plan

1. **Start vedolizumab**: 300 mg IV at weeks 0 and 2 at Riverbend Health Infusion Center, then Entyvio Pen 108 mg subcutaneously every 2 weeks from week 6. Referral, prescription and infusion orders to Riverbend Health Specialty Pharmacy for benefits verification and prior authorization.
2. Continue prednisone 40 mg daily; taper by 5 mg weekly once vedolizumab is started.
3. Continue mesalamine 4.8 g daily for now.
4. QuantiFERON-TB Gold and hepatitis B surface antigen negative 09/25/2026. Vaccines reviewed.
5. Continue oral iron; recheck CBC in 4 weeks.
6. Return 4 weeks after the first infusion. Call sooner for fever, more than 10 stools a day or heavy bleeding.

SYNTHETIC DEMO DATA, NOT A REAL PATIENT

NORTHLAKE GI ENDOSCOPY CENTER

2200 Shoreline Dr, Suite 100, Harbor City, IL 60699 | (312) 555-0118

Procedure Report: Colonoscopy

Patient name:	Reyes, Dana	**Procedure date:**	09/18/2026
Date of birth:	04/12/1991 (35 y, F)	**Attending:**	Morgan Patel, MD
MRN:	RB-2204871	**Referring:**	Rowan Ellis, MD
Procedure:	Colonoscopy with cold forceps biopsy (CPT 45380)	**Anesthesia:**	MAC, propofol (K. Lindqvist, CRNA)

Indication

Ulcerative pancolitis (K51.011) with 4 weeks of worsening bloody diarrhea. Assess extent and severity before a change in therapy.

Procedure

Informed consent obtained. ASA class II. Digital rectal exam normal. The colonoscope was advanced to the cecum, identified by the appendiceal orifice and ileocecal valve, and the terminal ileum was intubated. Bowel preparation: Boston Bowel Preparation Scale 7 (right 2, transverse 3, left 2). Withdrawal time 11 minutes. The patient tolerated the procedure well. No immediate complications.

Findings

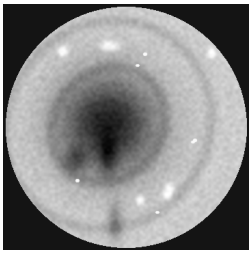

1. Continuous, circumferential inflammation from the rectum to the cecum with marked erythema, absent vascular pattern, friability, spontaneous bleeding and multiple ulcerations. **Mayo endoscopic subscore 3** in all segments examined. Cold forceps biopsies taken by segment (jars B to E).
2. Terminal ileum normal over 8 cm; biopsied (jar A).
3. No polyps, masses or strictures.

Impression

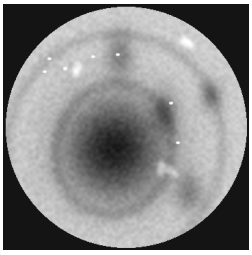

Severe ulcerative pancolitis, Mayo endoscopic subscore 3, extending from the rectum to the cecum, consistent with moderately to severely active ulcerative colitis. Normal terminal ileum.

Recommendations

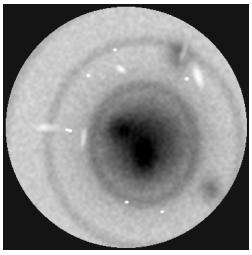

- Await pathology.
- Labs: CRP, fecal calprotectin, CBC, albumin; QuantiFERON-TB Gold and hepatitis B screening before advanced therapy.
- Clinic follow-up to start advanced therapy. Begin prednisone if symptoms progress before the visit.

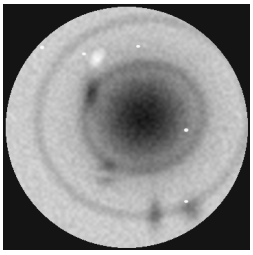

1. Rectum

2. Sigmoid colon

3. Transverse colon

4. Cecum

Pathology addendum (09/21/2026), Harbor City Pathology Associates, Imani Castellan, MD

A. Terminal ileum, biopsy: no diagnostic abnormality.
B to E. Colon and rectum, biopsies: **chronic active colitis** with crypt abscesses, basal plasmacytosis and architectural distortion, consistent with ulcerative colitis. No dysplasia. CMV immunostain negative.

Electronically signed: Morgan Patel, MD, 09/18/2026 11:02 CDT. Addendum reviewed 09/21/2026.

GASTROENTEROLOGY CLINIC NOTE

Patient: REYES, DANA
MRN: RB-2204871
Physician: Morgan Patel, MD, Gastroenterology
DOB: 04/12/1991
Date of visit: 03/14/2023

Interval history

Ms. Reyes is a 31-year-old woman with ulcerative pancolitis diagnosed 03/2021 (colonoscopy: continuous inflammation from rectum to cecum). She continues to have 5 to 6 bloody stools daily with urgency despite maximal oral therapy, and her symptoms return whenever prednisone is tapered below 15 mg.

Treatment history

Mesalamine 4.8 g/day since 2021 with inadequate response. Azathioprine was started 02/2022 and stopped in 2022 for nausea and raised liver enzymes (ALT 168 U/L at 3 months). Two prednisone courses in 2022, each followed by relapse on taper.

Pre-treatment screening

QuantiFERON-TB Gold negative (02/27/2023). Hepatitis B surface antigen and core antibody negative. Weight 62 kg. Vaccines reviewed; influenza and pneumococcal vaccines given.

Assessment

Moderately to severely active ulcerative pancolitis, steroid dependent, with inadequate response to an aminosalicylate and intolerance of a thiopurine.

Plan

1. Starting Inflectra 5 mg/kg IV weeks 0, 2, 6, then every 8 weeks. Dose 300 mg at 62 kg (rounded to the nearest vial). Prior authorization to be submitted to her current plan.
2. Continue mesalamine 4.8 g/day.
3. Prednisone 20 mg daily, taper by 2.5 mg weekly after the second infusion.
4. Return after the week 6 infusion.

SYNTHETIC DEMO DATA, NOT A REAL PATIENT

Northlake GI Associates
2200 Shoreline Dr, Suite 300, Harbor City, IL 60699 Tel (312) 555-0118 Fax (312) 555-0119

GASTROENTEROLOGY CLINIC NOTE

Patient:	REYES, DANA	**DOB:**	04/12/1991
MRN:	RB-2204871	**Date of visit:**	09/10/2024
Physician:	Morgan Patel, MD, Gastroenterology		

Follow-up: ulcerative pancolitis

Ms. Reyes returns for follow-up of ulcerative pancolitis. Over the past two months she reports 6 to 7 stools a day with visible blood on most days, urgency, and fatigue. No fever. Weight down 2 kg. She missed no doses.

She had a good clinical response after induction in spring 2023 and was in steroid-free remission through late 2023. Symptoms returned in early 2024. The infusion interval was shortened to every 6 weeks in 03/2024 and to every 4 weeks in 06/2024, with only brief benefit after each dose. Stool studies in 08/2024 were negative for C. difficile and enteric pathogens.

A drug level was drawn before the 08/27/2024 infusion and returned last week. Reviewing the level together with her symptom course, this is most consistent with secondary loss of response to Inflectra despite interval shortening; low trough with antibodies to infliximab detected; Inflectra discontinued today after discussion with the patient, and no further infusions will be scheduled. We talked about another agent in the same class versus a change in mechanism, and given the antibodies she prefers a gut-selective therapy.

Assessment and plan

Moderately to severely active ulcerative pancolitis with secondary loss of response as above. Prednisone taper as a bridge: 40 mg daily, decrease by 5 mg weekly. Continue mesalamine 4.8 g daily. Vedolizumab when coverage allows; her current plan has not approved it and she expects a change in insurance. Return in 6 weeks, sooner for worsening bleeding or fever.

ADDENDUM

Addendum to office visit of 10/02/2026

Patient: Reyes, Dana	**DOB:** 04/12/1991 (35 y)	**Sex:** F
MRN: RB-2204871	**Date of service:** 10/04/2026	**Provider:** Morgan Patel, MD, Gastroenterology

Addendum

Spoke with the patient by phone on 10/04/2026 to review symptoms while the vedolizumab referral is prepared. Stools are down to 7 to 8 a day on prednisone 40 mg with less bleeding. Tolerating food and fluids, afebrile, no dizziness. She does not meet criteria for admission.

Standard review appropriate; no expedited request. We will ask for an expedited review only if her symptoms worsen while the authorization is pending. She will call the office for fever, more than 10 stools a day or heavy bleeding.

Electronically signed by Morgan Patel, MD on 10/04/2026 at 11:06 CDT
